Major improvements ahead at I-25/Crossroads interchange

It's not the final solution, but it’s a strong start.

Construction bids will soon be accepted for a $6.5 million project at the Crossroads Boulevard exit at I-25. The improvements will ease traffic backups, reduce accidents and provide employment.

The project falls under the "shovel-ready" category and is being launched with the hope of $3 million in federal stimulus money.

The project will help to alleviate a traffic flow squeeze under the I-25 bridges across Crossroads Boulevard. The road under the bridges is only two-lanes wide, while the road on either side is four lanes.

A traffic backup can occur when a vehicle must wait to make a left turn. All the traffic behind that vehicle must wait too.

The ultimate solution will be replacing the I-25 bridges with wider-span bridges and a wider road beneath. The interim solution is the current project, which will include new I-25 entrance and exit ramps from Crossroads and a pair of roundabouts.

The ramps will be located further from the bridges and the two-lane squeeze, and the roundabouts will enable through-traffic to proceed while a left turn is being made.

There is currently no plan or money for the estimated $20 million bridge replacement by the Colorado Department of Transportation. But the current improvements will be incorporated with bridge replacements whenever that might occur.

It is anticipated that bids will be opened, contracts approved and work begun this summer with project completion expected next spring, weather permitting.

During the past few years, Crossroads Boulevard has been widened on both sides of I-25 to serve new developments — The Ranch, four new hotels, car and motorcycle dealerships, a restaurant and other buildings. But the under-bridge crunch remains.

At rush hour, backups occur. It’s especially bad when there’s a special event going on, such as a show at the Budweiser Events Center or the Clear Channel Amphitheater.

Backups cause impatience, and impatient drivers sometimes take chances that result in accidents.

Roundabouts are proven to handle traffic flow better than stop signs, plus they reduce the frequency and severity of accidents. With the current four-into-two squeeze and ramp locations, traffic lights would only make the situation worse.

The money; where is it coming from?

The project will cost about $6.5 million, with the funds coming from three major sources. Because the plans are already drawn—all 300+ pages—the project is ready to be bid and therefore qualifies as “shovel-ready.” The project will receive $3 million in federal stimulus funding.

An additional $1.2 million will come from other federal funding. The rest, about $2.3 million, comes from the fees paid by Centerra development, money already collected and set aside for public transportation improvements. No funding from the regular City budget is required. All the funding currently exists. No additional fees, taxes or bonds will be required.
